

How to correctly soak OASIS[®] Floral Foam Maxlife Bricks...

Single Brick

1. Use the “float soak” method and place the floral foam brick (or any portion of it) onto the top of a solution of fresh water and **Floralife[®] Flower Food**.

2. Always float soak your brick logo side up in a large, deep container allowing the water to circulate freely around and into the brick. A container which can hold water that is double the depth of a brick is ideal.

3. Let the floral foam absorb the water until it rests at the surface or sinks to the bottom of the soaking container.

OASIS[®] Floral Foam Maxlife is made to stay wet, hold your flowers in place, and keep them fresh.

You’ve built your reputation on beautiful arrangements. We’ve built ours on quality and consistent performance — brick by brick.

There may be other green bricks that hold water, but there’s no substitute for OASIS[®] Brand Floral Foams.

That’s why it’s important to make sure that you are soaking your OASIS[®] Floral Foam Maxlife bricks correctly in order to get maximum benefit for your flowers.

Multiple Bricks

1. Use the “float soak” method and place the bricks evenly apart onto the top of a solution of fresh water and **Floralife[®] Flower Food**.

2. Always float soak your bricks logo side up in a large, deep container allowing the water to circulate freely around and into each of the bricks. A container which can hold water that is double the depth of a brick is ideal.

3. Be patient! Wait until all bricks are fully soaked before removing as ripples in the water can ride over the bricks and cause dry spots.

How **NOT** to soak OASIS[®] Floral Foam Maxlife Bricks...

Single Brick

1. Never plunge or push bricks under the water.

2. Plunging allows air bubbles to get trapped preventing the floral foam from soaking fully.

3. If the bricks have not been soaked correctly dry spots will appear within the floral foam prohibiting the transfer of water from the foam to flower stems.

Multiple Bricks

1. Don't rush! Make sure that the container used to soak bricks is large enough and deep enough to allow the water to circulate freely around and into the bricks.

2. Avoid piling the bricks on top of each other as this could affect the bricks ability to fully soak.

3. If the bricks have not been given enough time and space to absorb water fully then dry spots will appear within the floral foam prohibiting the transfer of water from the foam to flower stems.
